LINCOLN

**CaHRU and LIH Improvement Science and Research  
Methods seminar**

**Conducting systematic reviews of  
qualitative research studies**

**Patients' experiences and perceptions of GBS and its variants at diagnosis,  
discharge and during recovery**

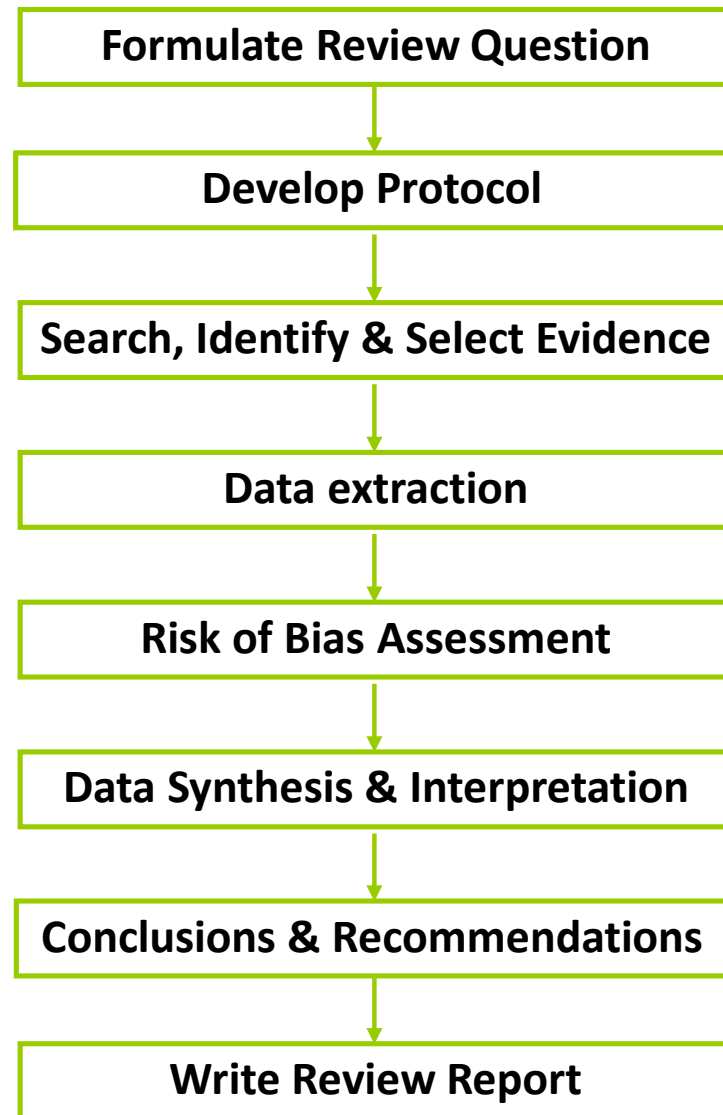

**Dr Ffion Curtis & Despina Laparidou**

# Systematic review of qualitative research studies

- Systematic Review:
  - A comprehensive, unbiased synthesis of many relevant studies in a single document using rigorous and transparent methods;
  - A scientific methodology that is reproducible and amenable to rigorous evaluation.
- Types of systematic reviews:
  - Quantitative systematic review & meta-analysis;
  - Qualitative systematic review;
  - Systematic mixed studies review;
  - Umbrella review.

# Key stages in conducting a systematic review

# Formulate review question

## PICo

- Population
- Phenomena of Interest
- Context

### Example

- What are **patients'** experiences and perceptions of GBS and its variants at diagnosis, discharge and during recovery?

Population

Phenomena of Interest

Context

UNIVERSITY OF  
LINCOLN

# Develop protocol

- The review protocol is the first major milestone of any systematic review
  - Provides a rigid, well-specified plan for how each stage of the review will be conducted – a roadmap;
  - Helps to avoid or minimise bias at each stage of the review – but only if followed rigidly;
  - Should be sent for external peer review, e.g. advisory group comprising researchers, practitioners, users, etc.;
  - Should be published, e.g. project webpage, research register, or peer-reviewed journal.
- The review protocol was registered with the PROSPERO International prospective register of systematic reviews (CRD42019122199) and is available from:  
[http://www.crd.york.ac.uk/PROSPERO/display\\_record.php?ID=CRD42019122199](http://www.crd.york.ac.uk/PROSPERO/display_record.php?ID=CRD42019122199)

# Systematic review standards

- Reporting standards exist to guide review reports:
  - PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses);
  - PRISMA-ScR (PRISMA Extension for Scoping Reviews);
  - ENTREQ (Enhancing Transparency in Reporting the Synthesis of Qualitative Research);
  - Cochrane Handbook and MECIR (Methodological Expectations of Cochrane Intervention Reviews).

- We used the ENTREQ guidelines for enhancing transparency in reporting the synthesis of qualitative research.

ENTREQ checklist (Enhancing transparency in reporting the synthesis of qualitative research) \*

No. Item	Guide questions/description	Reported on Page #
1. Aim	State the research question the synthesis addresses	Title & 5-6
2. Synthesis methodology	Identify the synthesis methodology or theoretical framework which underpins the synthesis, and describe the rationale for choice of methodology (e.g. meta-ethnography, thematic synthesis, critical interpretive synthesis, grounded theory synthesis, realist synthesis, meta-aggregation, meta-study, framework synthesis)	8-9
3. Approach to searching	Indicate whether the search was pre-planned (comprehensive search strategies to seek all available studies) or iterative (to seek all available concepts until they theoretical saturation is achieved)	6-7
4. Inclusion criteria	Specify the inclusion/exclusion criteria (e.g. in terms of population, language, year limits, type of publication, study type)	6
5. Data sources	Describe the information sources used (e.g. electronic databases (MEDLINE, EMBASE, CINAHL, psycINFO), grey literature databases (digital thesis, policy reports), relevant organisational websites, experts, information specialists, generic web searches (Google Scholar) hand searching, reference lists) and when the searches conducted; provide the rationale for using the data sources	6-7
6. Electronic Search strategy	Describe the literature search (e.g. provide electronic search strategies with population terms, clinical or health topic terms, experiential or social phenomena related terms, filters for qualitative research, and search limits)	67 Appendix 2

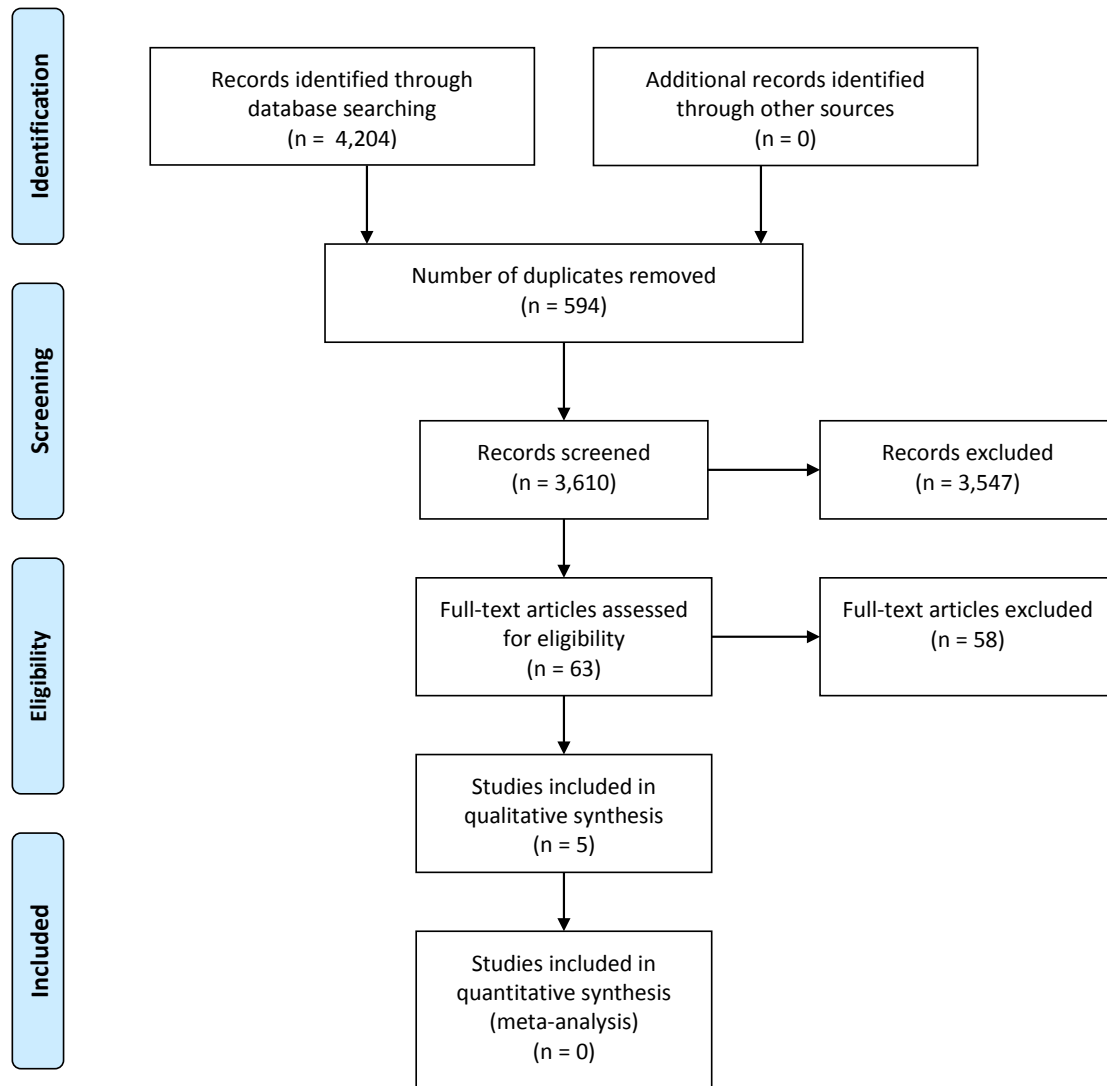

# Construct your search strategy

Search ID	MeSH (Medical Subject Headings)	Search terms	Results

## PRISMA 2009 Flow Diagram

# Data extractions

- Recording of information presented in primary studies
- Strike the right balance between reporting/recording too much or too little information
- Important data to extract:
  - **Participants:** demographic/disease characteristics, inclusion/exclusion criteria, sample size;
  - **Study characteristics:** aims, objectives, research questions, study design, setting, sampling method, data collection methods (e.g. interview, focus groups);
  - **Data analysis:** e.g. thematic analysis, interpretative phenomenological analysis, etc.;
  - **Results:** use NVivo software to facilitate analysis.

**Balancing everyday life two years after falling ill with Guillain-Barré syndrome: a qualitative study**

**Forsberg et al., 2015**

**Results**

*Lived body restrictions*

A body that restricts. The participants described various bodily restrictions that still limited them in their everyday activities even two years after the onset of Guillain-Barré syndrome. They described large variations in symptoms; weakness and sensory sensations in their legs and arms, ache, and loss of energy. As well as limitations in everyday activities, they also expressed restricted possibilities for participation in society. Standing or walking for prolonged times were described as exhausting.

Sometimes I find it's hard just to walk 50 metres...when my legs are so tired. You end up in an odd position with your knees going in as you try to find some other way of doing it that will work [Participant (P) 18]

Participants who were more physically disabled described dependency on assistive mobility devices, however weak hand muscles made it difficult to grip wheelchair bars. Some used electric wheelchairs for longer distances, increasing their opportunities to participate in activities. However, some expressed frustration in relation to tasks, such as visiting shops, as there were often stairs and curbs.

Then there are all these little challenges you never think about when you're healthy. When you suddenly have to go into a store - there aren't that many provisions for disabled people. [P 15]

Participants with residual weakness in their hands also described the frustration of not being able to perform simple household chores. For some participants, sewing and knitting had been valuable leisure activities, and they described with sadness their limitations when trying to do such tasks.

"Once in a while I've tried to sew on a button. But it goes so badly I just want to chuck it all away. It's a real pain." [P11].

A specific bodily restriction mentioned by a couple of participants was facial dysfunction caused by continued paresis of the facial muscles. These participants were of younger age, and in the middle of careers and settling down in families. They described being frequently reminded of their problems when eating, as they hoarded food in their cheeks and were not able to eat thin liquids.

They described experiencing a reduction in the intensity of their emotions owing to, for example, being unable to smile. An everyday task such as talking on the phone was described as a struggle if one had difficulty pronouncing some letters.

Oh yeah, you feel it every day - it doesn't leave you untouched. No. It...you notice it when you talk, when you're about to eat then it's like...en you're dealing with it every day: every time you: [P 18]

# Risk of bias assessment

Critical appraisal focuses on:

- congruity between philosophical position adopted in the study, study methodology, study methods, representation of the data and the interpretation of the results;
- Critical appraisal tools enable you to systematically assess the trustworthiness, relevance and results of published papers;
- Two reviewers will independently assess risk of bias

## Findings/Results (Primary Data Excerpts to be extracted into NVivo Software)

**Risk of Bias** Two reviewers will independently assess risk of bias within included studies using the Critical Appraisal Skills Programme (CASP) Qualitative Checklist (2017).

	Yes	No	Can't tell	Support for judgement (include direct quotes where available with explanatory comments)	Location in text or source (pg & ¶/fig/table)
1. Was there a clear statement of the aims of the research? <i>Consider</i>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>		221
2. Is a qualitative methodology appropriate? <i>Consider</i>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>		
3. Was the research design appropriate to address the aims of the research? <i>Consider</i>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	It appears to be appropriate, but the authors do not comment on this	221
4. Was the recruitment strategy appropriate to the aims of the research? <i>Consider</i>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>		221

5. Was the data collected in a way that addressed the research issue? <i>Consider</i>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Not clear if they reached data saturation, but many argue that data saturation would only be relevant for grounded theory	221
6. Has the relationship between researcher and participants been adequately considered? <i>Consider</i>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>		
7. Have ethical issues been taken into consideration? <i>Consider</i>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Ethics approval obtained, but no further info given	221

going back to work is a step forward

<Internals\Royal et al 2009> - 5 2 references coded [1.03% Coverage]

Reference 1 - 0.40% Coverage

1 had been sort of moping around . . . trying to pass the time to get better, about 3 months by then, and I got to a stage where nothing was happening, it probably was but I thought nothing was happening and my life, it wasn't my life . . . I felt that nothing was making anything change so I thought maybe it was something in my head, so if I go back to work, go back to a normal life at least it will be a step forward'.

Reference 2 - 0.63% Coverage

Relating to colleagues made an important contribution to feeling 'normal' again. I think probably a lot of people thought I was coming back too early. That's not really for them to say, but I think that they were surprised I came back so soon, but I think it is important to get back on board, need the company and intellectual stimulation. Brain was starting to numb out a bit, definitely, and you know it's quite a close knit company that I work at. I consider them all to be friends as well, so there is a support structure there and also just a desire to move on and get this thing behind me. One of the best ways of doing that is going back to work, definitely', (Andrew).

# Thomas & Harden (2008) Thematic synthesis

Analytical themes	Descriptive themes	Parent codes	Quotes
From uncertainty to hope	Rationalising symptoms & misattributing diagnosis	Attributing GBS to stress	"...one participant attributed the onset of GBS to severe stress, so became diligent about limiting his responsibilities at work."
		Fears of having cancer or MS	"Some also described a fear of having a better-known disease such as cancer or multiple sclerosis."
		Initially attributing symptoms to fatigue, medication, infection, etc.	"A few persons tried to ignore the strangeness of their bodies, but others came up with explanations such as being tired or overworked."
		Initially ignoring symptoms	"At first, these strange sensations were ignored but after a couple of days the feelings of illness increased."
		Misdiagnosis by healthcare staff	"This participant went to the physician's office for care. The physician's office called for emergency support and transport because they felt this participant was having a stroke."
	Participants were eager to find out what's happening to them/Relief about diagnosis	Relieved to be admitted to hospital	"Glad that I'd arrived someplace where somebody could help me. Relieved a little bit. I guess when I was admitted to the hospital that they were glad they didn't send me home...and after the ICU experiences, I began to awake and learn more about what I had."
	Prognosis	Relying on the promise of recovery	"The concern of having a very serious disease and the fact of a prolonged recovery was becoming a realization, while others in the same situation still continued to rely heavily on the prospect of a positive prognosis."
		Some received more pessimistic prognosis	"For instance, a few persons received a more pessimistic prognosis early in the course of disease."
		Some were sad & disappointed re the long recovery	"A couple of persons described a growing awareness soon after the diagnosis, that recovery would take a long time and that this made them disappointed and sad."
	Uncertainty	Uncertainty	"The uncertainty was overwhelming for many and affected their whole lives."
	Need for information	GBS info reassuring	"Frank information about the course of disease made many persons feel secure, even when the paralysis increased. They knew that the paralysis could affect their respiratory muscles and that mechanical ventilation could be necessary."

# Present results- Evidence table

**Table 2. Study characteristics**

Study	Study aims	Sample	Method of data collection	Method of data analysis
Cooke & Orb, 2003; Australia	To “examine the perspectives of patients with Guillain-Barré syndrome during their recovery phase”	Purposive sampling of 5 participants (3 male, 2 female) admitted to the hospital with a diagnosis of GBS; discharged from hospital in the last 2 years Ages: 28-67 years	Semi-structured individual interviews with open-ended questions	Constant comparative method
Forsberg et al., 2008; Sweden	To “describe experiences of falling ill with GBS, with the focus on the onset of disease, the diagnosis and the illness progress during hospital care”	The study population (35 participants: 22 male, 13 female) was identified in a previous multicentre study, including eight hospitals. Participants were approached 2 years after illness onset. Ages: 20–78 years	Individual interviews	Content analysis
Forsberg et al., 2015; Sweden	To “describe experiences of disability in everyday life and managing the recovery process two years after falling ill with Guillain-Barré syndrome”	The study population (35 participants: 22 male, 13 female) was identified from a previous longitudinal study. Participants were approached 2 years after illness onset. Ages: 22-80 years	Semi-structured individual interviews	Content analysis
*Hooks, 2015; USA	To “gain a richer understanding of the patient’s recalled experience of an acute episode of moderate to severe Guillain-Barre’ syndrome”	Individuals, from eight different states, with a prior self-identified diagnosis of moderate to severe GBS. The sample (recruited through	Semi-structured individual interviews	Content analysis

# Our systematic review- Conclusions

- Exploring this literature has enabled us to:
  - Identify how patients may need extra support to cope better with their recovery;
  - Identify ways that healthcare professionals and services can help facilitate further such a recovery.
- One of the most important areas that needs to be addressed is the lack of knowledge about GBS among the majority of healthcare professionals.
- One factor that positively influenced management and eventually outcomes was having a positive attitude and thinking towards recovery.
- Being diagnosed with and surviving GBS was a life-changing experience for all participants.

# Disseminate findings

- Failing to disseminate research findings is unethical, and the protocol should detail precisely a dissemination strategy:
  - How will you disseminate the findings? Where will you publish?
    - Project report to GAIN charity
    - Peer-reviewed journal
    - Conferences
  - Who is your intended audience?
    - People diagnosed with GBS & their relatives/carers
    - Healthcare professionals
    - Social services
- Manuscript currently in preparation (Social Science & Medicine)
